Deleting weak content is the highest-leverage work I do.

Why the best content work is subtraction, not generation.

10 slides · swipe

Anton Petnitsky · Python / agents / backend

More isn't better. Better is better.

Anyone can generate 10,000 exam questions. Learners notice the first 50 and the quality bar. After that, volume is just noise you shipped.

Garbage × 10,000 = garbage.

My Russian-track audit in three numbers.

6 203

items audited for topic fit

45%

tested the wrong skill entirely

2 777

archived — reversible, backed up

The audit is Botka's single biggest quality jump.

Anton Petnitsky · Python / agents / backend

What my gate actually rejects.

01 Duplicates and near-duplicates

02 Two defensible answers inside one item

03 Explanations that don't match the answer

04 Content that can't cite a rule or source

05 Anything the reviewer can't defend aloud

If it survives the defense, it ships. If not, it goes.

Anton Petnitsky · Python / agents / backend

BOTKA · HOW WRONG · 5/10

Confident wrongness is the enemy.

A plausible answer with a confident wrong explanation teaches the exam and destroys the learner. It looks fine on every dashboard until the learner's score collapses.

Confidence persuasion ≠ knowledge.

Anton Petnitsky · Python / agents / backend

The content review order.

01 Model screens for obvious problems (schema, counts)

02 Human defends a random sample aloud

03 Weak items deleted — no rescue by rewriting

04 Everything ships with a traceable reason

Editing makes it polished. Deleting makes it honest.

Anton Petnitsky · Python / agents / backend

The only content metric that matters.

Volume is the number nobody trusts. Rejection rate is the one worth a dashboard.

If your pipeline can't say no, it isn't curated — it's loud.

Anton Petnitsky · Python / agents / backend

Audit yours in one afternoon.

Pull 50 random published items. Read each with a hostile ear. Count the ones you wouldn't defend. That fraction is your real quality bar — the rest is paperwork.

One afternoon.
Honest number.

Anton Petnitsky · Python / agents / backend

Never delete without a backup.

My 'delete' is an archive flag — reversible, timestamped, backed up. If the audit was wrong, the item comes back in seconds. Deletion is confidence backed by infrastructure.

Soft delete everything.
Hard decisions, soft data.

BOTKA · KEEP THIS · 10/10

Save this for your next content review.

Your next quality jump probably isn't a better generator. It's a stricter gate, honestly applied — and the courage to press delete.

Save for later review
