BOTKA · REJECT FIRST · 1/10

More generation did not make Botka better.

The review gate that turned my Russian-language exam prep pipeline into something worth publishing.

10 slides · swipe

Anton Petnitsky · Python / agents / backend

Volume is not quality.

The pipeline generated questions fast. Nobody complained about the number.

Learners complained about being unfairly scored.

Output grew.
Trust dropped.

Every item passes one gate.

01 Source exists and is verifiable

↓

02 Not a duplicate of anything banked

↓

03 Exactly one defensible correct answer

↓

04 Explanation survives a hostile read

↓

05 Human reviewer approves

↓

06 Only then: published

Generation is a step, not the goal.

Anton Petnitsky · Python / agents / backend

What the gate actually rejects.

01 Duplicates and near-duplicates

02 Two defensible answers (ambiguous stem)

03 Explanation that doesn't match the answer

04 Key rule students can't look up

05 Grammar masquerading as subject knowledge

06 Explanation too vague to teach anything

Most rejects are invisible in development. Users see them first.

Anton Petnitsky · Python / agents / backend

The audit was not gentle.

45%

of screened Russian items tested the wrong skill

6 203

items audited by the topic-fit check

2 777

items archived with a reversible backup

Source: topic-fit check over 6,203 audited items, Russian track.

Anton Petnitsky · Python / agents / backend

Curation is the feature.

Deleting plausible garbage beats shipping fluent filler.

One sound answer teaches more than ten confident, wrong ones.

Anton Petnitsky · Python / agents / backend

BOTKA · HUMAN REVIEW · 7/10

Human review lives where uncertainty concentrates.

Deterministic checks (duplicates, schema, answer counts) catch the bulk mechanically. Humans see grammar, semantics and taste — the parts a model can confidently get wrong.

Machines filter the volume.
Humans decide the border.

Anton Petnitsky · Python / agents / backend

Measure rejection, not generation.

BOTKA · YOUR AUDIT · 9/10

Five questions for your content pipeline.

01 Can a senior reviewer defend every published item?

02 Are duplicates caught before the learner sees them?

03 Is the correct answer actually unique?

04 Does the explanation teach the mechanism, not just the key?

05 Could you restore the archive if the audit was wrong?

If any answer is 'no', your pipeline publishes debt.

Anton Petnitsky · Python / agents / backend

BOTKA · KEEP THIS · 10/10

Save this for your next content audit.

The unglamorous gate is why a learner opens the app and trusts it. Volume is easy. Verification is the product.

Save for later review
