Screenshots are not evidence.

What it takes to prove a browser agent finished the job — in practice, not in a demo.

Anton Petnitsky · Python / agents / backend

A frozen view proves nothing moved.

A screenshot shows the page at one instant. It cannot tell you the submit went through, the backend saved, the queue fired.

Pixels can't prove a transition.
Only state can.

Anton Petnitsky · Python / agents / backend

The loop I build into every browser agent.

01 Inspect the live DOM and locate the real node

02 Act on it — nothing else

03 Re-read the DOM and the network result

04 Fail loudly if the transition didn't happen

Control without verification is motion.

Anton Petnitsky · Python / agents / backend

Why I built opencode-chrome.

62

MCP tools for DOM, network, storage, files and screenshots

1

invariant: act on the real node, verify the changed state

0

demo-ware — every tool earns its place by a real incident

github.com/Mukller/opencode-chrome — see the full tool list there.

Anton Petnitsky · Python / agents / backend

What silently broke in real runs.

The node went stale after re-render. A cookie banner ate the click. The form re-validated and reverted my input. The response was 200, the record never saved.

Every one of these passes in the happy path.

Anton Petnitsky · Python / agents / backend

Motion vs mastery.

DEMO	PRODUCTION
Looks done clicked screenshot OK 'done' says the agent	Actually done DOM re-read network confirms backend persisted

Recruiters look for the right column. So do users.

Anton Petnitsky · Python / agents / backend

The rule I hold browser agents to.

Never trust the click. Verify the consequence.

And never verify from the same layer that acted.

Anton Petnitsky · Python / agents / backend

What a trustworthy browser agent can see.

01 Real DOM — selectors resolved, not vibes

02 Network: status, payload, timing

03 Storage: what the app believes about you

04 Files — uploads and downloads actually landed

05 Permissions — what it was not allowed to see

Blind agents guess. Eyes-on agents check.

Anton Petnitsky · Python / agents / backend

How to review agent-written browser code.

01 Does it re-resolve the selector after navigation?

02 Does it assert the outcome, not just the action?

03 Does it handle stale nodes and re-renders?

04 Does it fail closed when state is ambiguous?

If any answer is 'no', it's a script, not a teammate.

Anton Petnitsky · Python / agents / backend

BROWSER AGENTS · KEEP THIS · 10/10

Save this for your next browser review.

Next demo of an agent clicking through a flow — ask how it knows it worked. The answer teaches you the whole stack.

Save for later review
