VOICE NOTES · QUALITY GATE · 1/10

'AI wrote it' is an intermediate step.

The quality gates my voice-notes pipeline runs before a note is safe to keep.

10 slides · swipe

Anton Petnitsky · Python / agents / backend

Raw output is a liability, not an asset.

A transcription model can produce polished paragraphs and still preserve nothing useful — it can get every word right and lose the context, the speaker, the reason the note existed.

Fluent ≠ trustworthy.
Both are cheap.

The gates, in order.

01 Hallucination filters on every whisper segment

↓

02 Segment deduplication — the same junk twice is not emphasis

↓

03 Speaker separation (resemblyzer embeddings)

↓

04 Structured output via LLM — decisions, tasks, tags

↓

05 A human reads it before anything downstream uses it

Each gate assumes the previous one lies.

Anton Petnitsky · Python / agents / backend

The two whisper metrics I trust.

```
$ whisper notes/ --small

avg_logprob < -1.0     → garbage

compression_ratio > 2.4 → looping

# drop before it reaches the note
```

Calibration on real recordings, not benchmarks.

Who said it matters more than what was said.

Resemblyzer embeddings + AgglomerativeClustering (pure cosine, threshold 0.30 calibrated on two TTS engines). My voice becomes 'Anton'; the other cluster becomes 'Speaker 2'.

**Separation first,
summarization second.**

What a bad note costs.

SHIPS FAST

Unverified note

confident text
no decisions
becomes 'proof'

SHIPS RIGHT

Gated note

uncertainty marked
decisions explicit
source of truth

A wrong note is worse than no note.

Anton Petnitsky · Python / agents / backend

Where the LLM belongs.

After the gates — never before. The model reorganizes, tags and summarizes clean text. It never sees raw audio noise and it never gets to override the filters.

**LLM as librarian,
not as court.**

Run this audit on your own AI workflow.

01 Does anything verify the model's output before use?

02 Is uncertainty marked, or silently flattened?

03 Can you trace every claim to audio or data?

04 Would you sign your name under the result?

If any 'no' survives, your pipeline trusts the model for free.

Anton Petnitsky · Python / agents / backend

The rule I hold all AI output to.

Trust nothing the system says about itself.
Verify at the boundary.

Especially when the output sounds most convincing.

Anton Petnitsky · Python / agents / backend

VOICE NOTES · KEEP THIS · 10/10

Save this for your next AI output review.

The quality bar isn't 'AI said it' — it's 'the gates passed and a human looked'. Build the gates before you trust the output.

Save for later review
